

Communications Rubric for Final Project Report

Section/Task	Emergent	Developing	Proficient
Abstract	Abstract may be missing key content. Motivation may be missing. Methods may be missing. Key results may be missing.	Abstract may be too long. Motivation may be vaguely defined, or not clearly connected to the project's contribution. Methods may be discussed in too much detail. Key results may be summarized, but not quantified.	Abstract is clear and concise. Motivation is clearly identified and connected to overview of the project's contribution. Key methods are summarized. Key results are summarized; when available, quantitative results are included.

Introduction (including related work)	The introduction is missing motivation. The text may discuss technical details without articulating the problem that the research intends to solve. Does not engage with related work. Methods are unclear or overly detailed. Reader cannot easily see how the approach addresses the problem.	Motivation is present, but may be underspecified, or not clearly connected to the goal of the research. Research problem may be vague, overly broad, or implied rather than clearly stated. The scope, importance, and/or relevance of the problem as it relates to the field of Computer Vision may be unclear. References relevant approaches or projects, but does not articulate the technical gap clearly. Does not fully connect papers cited and may not clearly specify how previous work relates to the project. Describes the general approach, but connections between methods and research goals may be implicit.	Clearly defines a specific research problem in Computer Vision Persuasively articulates motivation; connects that motivation to the problem that the research aims to solve. Effectively synthesizes and engages with related work, comparing/contrasting research approaches with existing approaches, and articulating the project's novelty with respect to previous work. Clearly and concisely describes the overall technical approach, showing how the methods are suited to addressing the stated problem.
---	---	---	--

Methods	Framing at beginning of Methods section is missing a clear explanation of what the writer(s) intend to show or investigate, and/or how the proposed approach addresses the problem articulated in the introduction.	Framing at beginning of Methods section may not clearly explain what the writer(s) intend to show or investigate. Framing at beginning of Methods section may not clearly explain how the proposed approach addresses the problem articulated in the introduction.	Methods section begins with framing, telling the reader what the writer(s) intend to show or investigate, and how their proposed approach addresses the problem as articulated in the introduction.
Results and Discussion	Results section may present findings without any framing on why each part of the experiment was carried out. Results section may present findings without interpreting their meaning. Discussion may not distinguish key findings, and may not clearly connect those findings to motivation. Discussion is missing potential ethical implications of the project.	Results section may present findings with limited context on why that part of the experiment was carried out. Results section may present findings but not consistently interpret their meaning. Discussion may not distinguish key findings, or may not clearly connect those findings to motivation. Discussion considers potential ethical implications of the project, but may not articulate potential	Results section frames each finding with context on why that part of the experiment was carried out. Results section both presents findings, and interprets them, including (if applicable) explanations of unexpected findings/errors. Discussion explains importance of key findings, in context of motivation articulated in introduction. Discussion considers potential ethical implications of the project,

	Discussion may be missing limitations of experiment and potential future work.	mitigation strategies for ethical issues. Discussion may be missing limitations of experiment, or potential future work. .	and posits potential mitigation strategies for ethical issues. Discussion considers limitations of experiment, and potential future work.
Conclusion	Restatement of contribution and connection back to motivation are missing.	Restatement of contribution may be missing or unclear. Connection back to motivation may be missing or unclear.	Conclusion clearly restates the main contribution of your project. Conclusion is connected back to project's motivation.
References	Some references may be missing. References may not be in CVPR formatting.	References are present, but not consistently in CVPR formatting.	References are presented in CVPR formatting.

Overall	Paper may lack clear structure or logical organization, which may impede the reader's understanding of the project goals. Writing may be difficult to follow due to unclear phrasing, undefined terms, or inconsistent terminology. Figures are missing several of the following textual elements: label, title, caption, and clear reference in the text	The paper has a logical overall structure, but transitions or connections between ideas may be implied, rather than clearly articulated. Writing is generally clear, but may include minor ambiguities or redundancies. Figures may not be clearly labeled, titled, captioned, and/or referenced clearly in the text.	Paper is well-organized and coherent, guiding the reader logically through motivation, context, approach, and contributions. Writing is clear, precise, and appropriate for a research audience in the field of Computer Vision. Figures are labeled, titled, captioned, and referenced clearly in the text. Paper includes a statement of contributions, if working on a team, and a statement on AI use.
